- Conclusion

- Summary of results
- Future improvements

Project Objectives

- The main goal of this project is to **design and implement an AI-based Intrusion Detection System (IDS) for IoT networks**. **IoT devices and Cyber-Physical Systems (CPS)** face unique **security challenges** due to their **limited computational resources**, **heterogeneous devices**, and **large attack surface**. **Traditional rule-based security mechanisms** often **fail to detect sophisticated or evolving attacks**. Therefore, **this project focuses on developing an intelligent and adaptive IDS using machine learning and deep learning techniques**.

- The specific objectives of this project are:
 - **Understand Security Threats in IoT-based CPS Environments**
 - Identify **common vulnerabilities** in **IoT devices** and **networks**.
 - Analyze the types of **cyber-attacks** that **IoT systems** are **susceptible to**, such as **Denial-of-Service (DoS)**, **Man-in-the-Middle (MITM)**, **Eavesdropping**, and **Data Injection Attacks**.
 - **Study AI-based Intrusion Detection Techniques**
 - Explore machine learning and deep learning approaches for detecting anomalies and attacks in network traffic.

- Evaluate the suitability of different algorithms for real-time IoT network security.
- **Design and Evaluate an AI-based IDS Model**
 - **Develop** a deep learning model that can classify **network traffic** as **normal** or **malicious**.
 - **Preprocess** and **scale IoT network datasets** for **model training**.
 - **Evaluate** the **effectiveness** of the **model** using **metrics** such as **accuracy**, **precision**, **recall**, and **F1-score**.
 - Analyze the **performance**, **limitations**, and **potential improvements** for **real-world deployment**.

Literature Review

- **Intrusion Detection Systems (IDS)** play a critical role in **securing IoT networks**, which are increasingly targeted by **cyber-attacks** due to their widespread deployment and limited device resources. This section summarizes existing research and approaches relevant to AI-based IDS for IoT networks.

- IDS in IoT Networks:

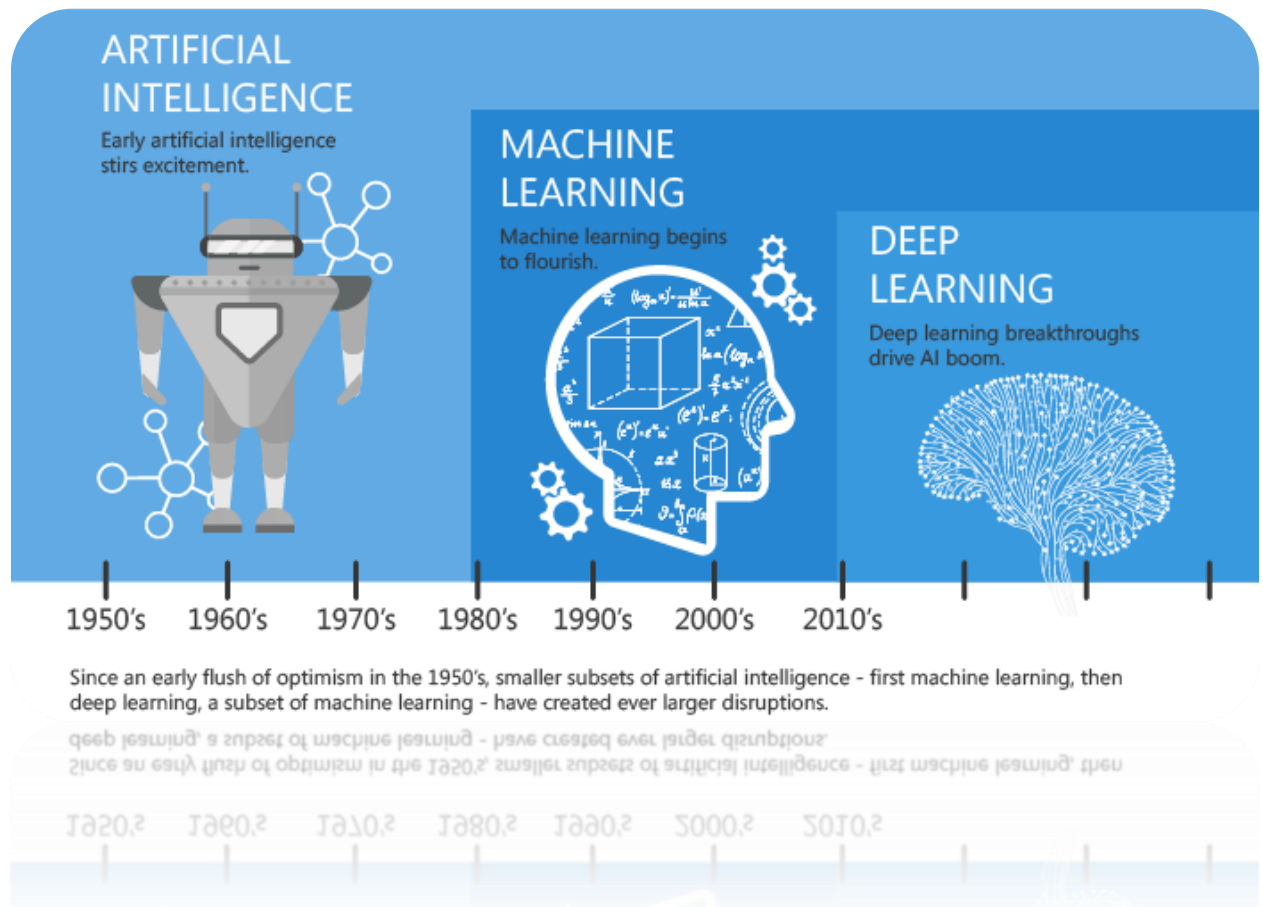

- **IoT networks** consist of **heterogeneous devices** communicating over **various protocols**, which introduces **unique security challenges**.
- **Traditional IDS approaches**, such as **signature-based** or **rule-based systems**, **often fail to detect new or evolving attacks**.
- **AI-based IDS** leverage intelligent algorithms to analyze network traffic and detect anomalies or malicious behavior in real-time.

- Machine Learning and Deep Learning for IDS:

- **Machine Learning (ML) techniques**, such as **Decision Trees**, **Random Forests**, and **Support Vector Machines**, can classify network traffic based on statistical patterns.
- **Deep Learning (DL) approaches**, such as **Artificial Neural Networks (ANNs)**, **Convolutional Neural Networks (CNNs)**, and **Recurrent Neural Networks (RNNs)**, can **automatically extract features** from **complex data** and **achieve higher accuracy** in **detecting unknown attacks**.

- AI-based IDS models can adapt to changing network conditions and evolving attack patterns, which is essential for IoT security.

- Common IoT Attacks:

- **IoT networks** are **susceptible** to **several types** of **cyber-attacks**:
 - **Denial-of-Service (DoS)**: Flooding the network or devices with excessive requests, causing them to crash or become unresponsive.
 - **Man-in-the-Middle (MITM)**: Intercepting and potentially altering communications between IoT devices.
 - **Eavesdropping**: Unauthorized monitoring of data transmissions.
 - **Data Injection Attacks**: Injecting malicious or false data into IoT systems to manipulate or disrupt operations.
 - **Malware-based attacks (e.g., Mirai)**: Infecting IoT devices to create botnets or launch coordinated attacks.

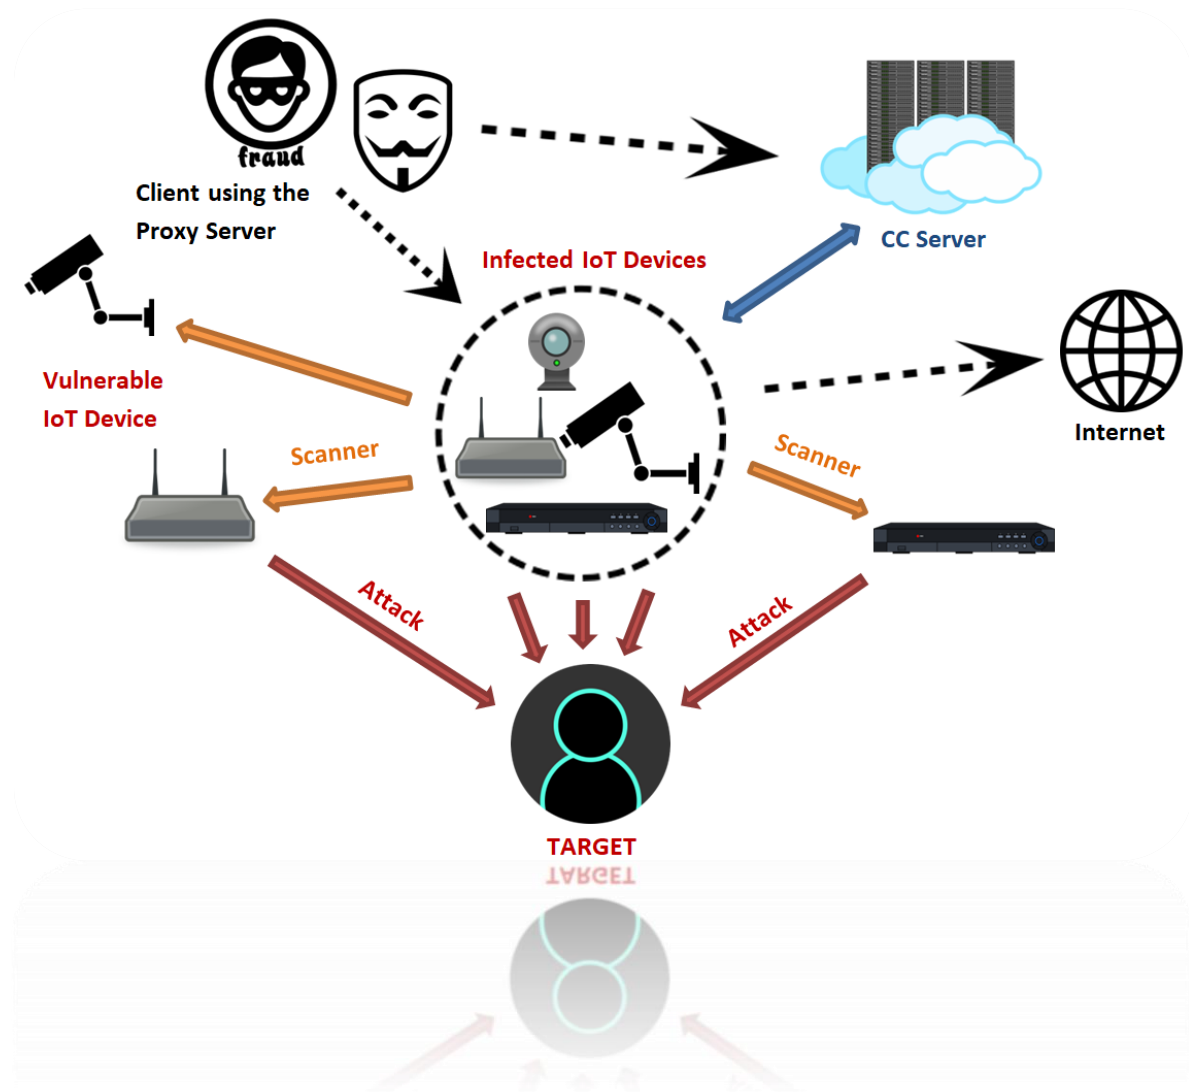

OWASP TOP 10

INTERNET OF THINGS 2018

- 1 Weak, Guessable, or Hardcoded Passwords**
 Use of easily bruteforced, publicly available, or unchangeable credentials, including backdoors in firmware or client software that grants unauthorized access to deployed systems.
- 2 Insecure Network Services**
 Unneeded or insecure network services running on the device itself, especially those exposed to the internet, that compromise the confidentiality, integrity/authenticity, or availability of information or allow unauthorized remote control...
- 3 Insecure Ecosystem Interfaces**
 Insecure web, backend API, cloud, or mobile interfaces in the ecosystem outside of the device that allows compromise of the device or its related components. Common issues include a lack of authentication/authorization, lacking or weak encryption, and a lack of input and output filtering.
- 4 Lack of Secure Update Mechanism**
 Lack of ability to securely update the device. This includes lack of firmware validation on device, lack of secure delivery (un-encrypted in transit), lack of anti-rollback mechanisms, and lack of notifications of security changes due to updates.
- 5 Use of Insecure or Outdated Components**
 Use of deprecated or insecure software components/libraries that could allow the device to be compromised. This includes insecure customization of operating system platforms, and the use of third-party software or hardware components from a compromised supply chain.
- 6 Insufficient Privacy Protection**
 User's personal information stored on the device or in the ecosystem that is used insecurely, improperly, or without permission.
- 7 Insecure Data Transfer and Storage**
 Lack of encryption or access control of sensitive data anywhere within the ecosystem, including at rest, in transit, or during processing.
- 8 Lack of Device Management**
 Lack of security support on devices deployed in production, including asset management, update management, secure decommissioning, systems monitoring, and response capabilities.
- 9 Insecure Default Settings**
 Devices or systems shipped with insecure default settings or lack the ability to make the system more secure by restricting operators from modifying configurations.
- 10 Lack of Physical Hardening**
 Lack of physical hardening measures, allowing potential attackers to gain sensitive information that can help in a future remote attack or take local control of the device.

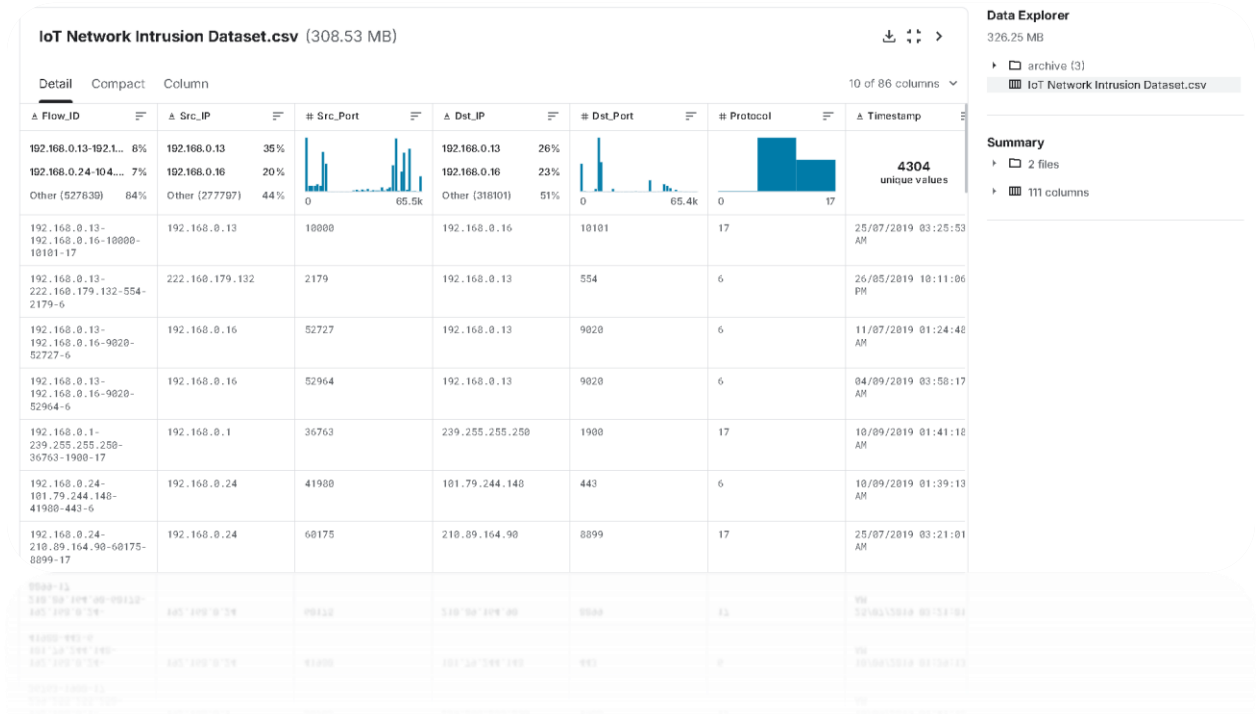

- 10 Information that can help in a future remote attack or take local control of the device**
 Lack of physical hardening measures, allowing potential attackers to gain sensitive information that can help in a future remote attack or take local control of the device.
- 9 Insecure Default Settings**
 Devices or systems shipped with insecure default settings or lack the ability to make the system more secure by restricting operators from modifying configurations.
- 8 Lack of Device Management**
 Lack of security support on devices deployed in production, including asset management, update management, secure decommissioning, systems monitoring, and response capabilities.

- **Mirai Botnet:** Mirai is one of the most infamous IoT malware strains. It infects IoT devices by exploiting default or weak passwords, turning them into a botnet. Once infected, these devices can be used to launch large-scale Distributed Denial-of-Service (DDoS) attacks, disrupting websites, networks, and online services. Variants of Mirai, such as Mirai-Ackflooding or Mirai-Hostbruteforce, target different IoT protocols and services, making it a persistent threat in IoT security.

- Public IDS Datasets:

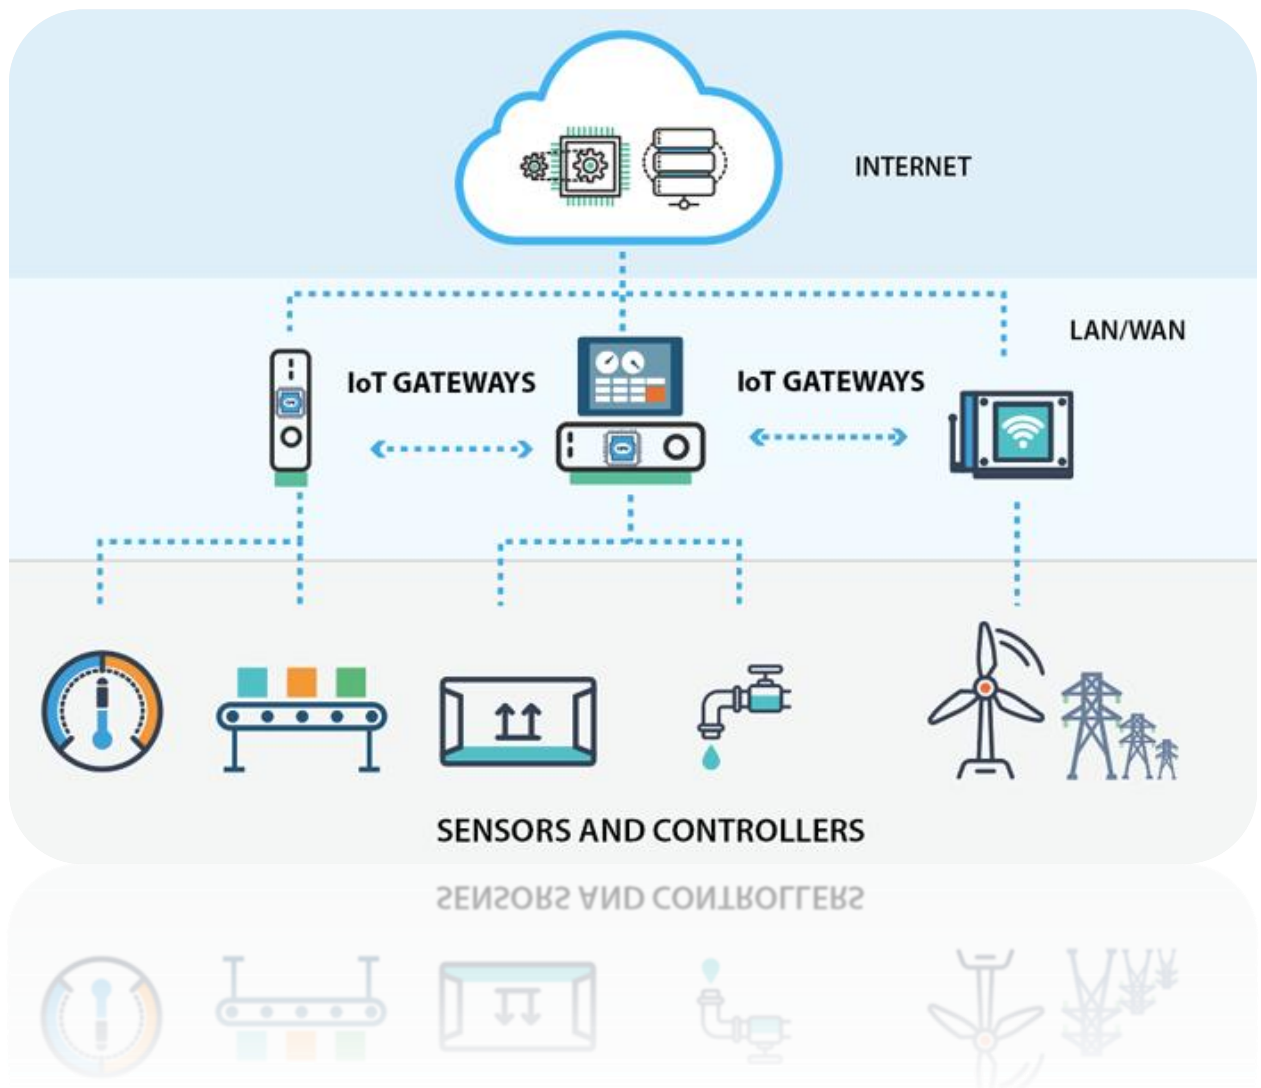

- For this project, we used the **IoTID20** dataset from **Kaggle**. This dataset contains **both normal and attack traffic in IoT networks, including attacks** such as **DoS, MITM, and scanning**. It is publicly available and can be accessed, just press [here](#).

- **Dataset details:**
 - **File:** IoT Network Intrusion Dataset.csv (308.53 MB)
 - **Usability score:** 2.94
 - **License:** Unknown
 - **Update frequency:** Not specified
- This dataset allowed us to train and **evaluate** the **AI-based IDS** for **detecting malicious activity in IoT environments**.

Task Description / Implementation

- The IoT system modeled in this project consists of a variety of connected devices such as sensors, cameras, smart appliances, and gateways. These devices communicate with a central network gateway or cloud service. The architecture can be represented as:
 - **IoT Devices:** Generate network traffic and collect data.
 - **Edge Gateway / Router:** Aggregates device traffic and forwards it to cloud or monitoring systems.
 - **Cloud/Server:** Performs data storage, analytics, and intrusion detection.

- **Potential Attack Points:**

- **Device Interfaces:** Weak authentication and default credentials make devices vulnerable to malware infection, including botnets like Mirai.
- **Communication Channels:** Traffic between devices and gateways may be intercepted or tampered with, allowing **Man-in-the-Middle (MITM) attacks**.
- **Network Layer:** Overloading devices or gateways can trigger **Denial-of-Service (DoS) attacks**.
- **Cloud or Server:** Compromised cloud servers can manipulate or inject malicious data into the IoT network.

- Identifying these attack points is critical to designing a robust Intrusion Detection System (IDS) that can monitor and classify abnormal traffic patterns.

- Analysis of Cyber-Attacks:

- This project focuses on detecting multiple attack types commonly observed in IoT networks.
- The **IoTID20 dataset** used contains labeled examples for the following **Attack Categories (Cat Column)** and **Attack Subcategories (Sub-Cat Column)** respectively:

Attack Categories (Cat column)

- **Mirai** – Botnet malware targeting IoT devices
- **DoS** – Denial-of-Service attacks
- **Scan** – Port and network scanning attempts
- **MITM ARP Spoofing** – Man-in-the-Middle attacks using ARP spoofing
- **Normal** – Legitimate traffic

• Normal – legitimate traffic

• MITM ARP spoofing – man-in-the-middle attacks using arp spoofing

Attack Subcategories (Sub-Cat column)

- **Mirai-Ackflooding** – Floods the network with ACK packets
- **Mirai-Hostbruteforceg** – Attempts to brute-force IoT devices
- **Mirai-UDP Flooding** – Sends high-volume UDP packets to overwhelm devices
- **Mirai-HTTP Flooding** – Floods web services on IoT devices
- **DoS-Synflooding** – TCP SYN flood attack
- **Scan Port OS** – Attempts to detect open ports and operating systems
- **Scan Hostport** – Host-level scanning of ports
- **MITM ARP Spoofing** – Intercepts network traffic
- **Normal** – Legitimate network activity

• Normal – legitimate network activity

• MITM ARP spoofing – intercepts network traffic

• scan hostport – host-level scanning of ports

- The **IDS** is trained to classify traffic into **normal** vs. **anomalous**, while also identifying **attack categories** and **subcategories**.

- **AI-Based IDS Design & Detection Workflow:**
 - o The **IDS** was implemented using **deep learning**, leveraging a **neural network** built with **TensorFlow/Keras**. The workflow includes:
 - **Data Preprocessing:** Before feeding the data into the **neural network**, **irrelevant columns** such as **IP addresses**, **timestamps**, and **categorical labels** that do not contribute to detection were **removed**. **Missing values** and **infinite values** were handled to ensure **data integrity**. Additionally, the **target labels** were **encoded numerically**, with **Normal** mapped to **1** and **Anomaly** mapped to **0**, enabling the network to perform **binary classification**.

X = X[[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99]]  
y = y[[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99]]  
# # #
```

- **Feature Scaling:** To prepare the data for **neural network training**, all **numerical features** were **normalized** using **StandardScaler**. This **standardization** ensures that **each feature has a similar magnitude**, which helps the **network converge faster** and **improves overall performance**.

```
# =====  
# SCALING  
# =====  
scaler = StandardScaler()  
X_train = scaler.fit_transform(X_train)  
X_test = scaler.transform(X_test)  
  
# SAVE SCALER AND LABEL ENCODER  
joblib.dump(scaler, "scaler.save")  
joblib.dump(label_encoder, "label_encoder.save") # Save label encoder too!
```

```
joblib.dump(scaler, "scaler.save")  
joblib.dump(label_encoder, "label_encoder.save")
```

- **Neural Network Architecture:** The **IDS model** was implemented as a **deep neural network** using **TensorFlow/Keras**. The input layer accepts **all preprocessed features**. **Two hidden layers** are employed: the **first contains 128 neurons** with **ReLU activation** and a **dropout rate of 0.3** to **reduce overfitting**, while the **second** has **64 neurons** with **ReLU activation** and the **same dropout rate**. The **output layer** consists of a **single neuron** with a **Sigmoid activation function**, producing a **probability** indicating whether a **network sample is normal or represents an attack**.

```

=====
# IDS MODEL (DEEP LEARNING)
# =====
model = Sequential([
    Dense(128, activation="relu", input_shape=(X_train.shape[1],)),
    Dropout(0.3),
    Dense(64, activation="relu"),
    Dropout(0.3),
    Dense(1, activation="sigmoid")
])

model.compile(
    optimizer="adam",
    loss="binary_crossentropy",
    metrics=["accuracy"]
)

early_stop = EarlyStopping(
    monitor="val_loss",
    patience=3,
    restore_best_weights=True
)

```

- **Detection Workflow:** During inference, **new network traffic samples** are **preprocessed and scaled** using the **same procedures** as for the **training data**. The **neural network** predicts the **probability** of a **sample being normal or malicious**. A **threshold of 0.5** is used for **classification**: **probabilities above 0.5** indicate **normal traffic**, while **probabilities below 0.5** indicate an **attack**. When an **attack is detected**, the system also **outputs the corresponding attack category and subcategory**, enabling **detailed analysis of the type of intrusion**.

```
# =====
# IDS DETECTION FUNCTION
# =====
def detect_intrusion(sample, cat, sub_cat):
    sample = np.array(sample).reshape(1, -1)
    sample = scaler.transform(sample)
    prediction = model.predict(sample, verbose=0)[0][0]

    # Debug: print prediction probability
    print(f"Prediction: {prediction:.4f} (1=Normal, 0=Anomaly)", end=" - ")

    if prediction > 0.5:
        return f"NORMAL TRAFFIC {cat}"
    else:
        return f"ATTACK DETECTED {cat} ({sub_cat})"
```

```
LOGGING f"ATTACK DETECTED {cat} ({sub_cat})"
6]26:
LOGGING f"NORMAL TRAFFIC {cat}"
LOGGING f"Prediction: {prediction:.4f} (1=Normal, 0=Anomaly)"
```

- **Evaluation Metrics:**

- To **evaluate IDS performance**, the **following metrics were used**:
 - **Accuracy**: Measures the proportion of correct predictions out of all samples.
 - **Precision**: Fraction of correctly predicted attacks out of all predicted attacks.
 - **Recall (Detection Rate)**: Fraction of correctly detected attacks out of all actual attacks.
 - **F1-Score**: Harmonic mean of precision and recall, balancing false positives and false negatives.
 - **Confusion Matrix**: Shows the distribution of true vs. predicted labels:

		Actual	
		1	0
Predicted	1	True Positives (TP)	False Positives (FP)
	0	False Negatives (FN)	True Negatives (TN)

- **Results:**
 - **Achieved ~99.6% accuracy on the test set**
 - **Minimal false positives (normal traffic misclassified as attack)**

```

```

- **Advantages and Limitations:**
 - **Advantages:**
 - **High accuracy** in detecting attacks in **IoT networks**
 - **Scalable to large-scale IoT environments**
 - **Limitations:**
 - **Requires labeled datasets** for supervised learning
 - May not detect extremely **rare** or **new attack types**
 - **Training** can be **resource-intensive** for **large networks**

Results / Simulation

- To **evaluate** the **performance** of the **AI-based IDS**, we tested the **trained model** on a **mixture of normal and attack traffic samples** from the **IoTID20 dataset**. For each sample, the **model predicts** the **probability** of the **traffic being normal** or an **attack**. Using a **classification threshold of 0.5**, the **model correctly identified all types of attacks**, including **Mirai-based attacks**, **Denial-of-Service (DoS) attempts**, and **network scans**, as well as **normal traffic**.
- For example, **normal traffic samples** were consistently classified as **NORMAL TRAFFIC**, while **attack samples** were correctly labeled with their corresponding **category** and **subcategory**, such as **ATTACK DETECTED → Mirai (Mirai-Ackflooding)** or **ATTACK DETECTED →**

DoS (DoS-Synflooding). The predictions also include the **confidence level**, allowing network administrators to assess the **certainty of each detection**.

```

 weighted avg      1.00      1.00      1.00     1000

WARNING: 2 normal samples are being classified as attacks!
```

Conclusion

- The **AI-based IDS** demonstrated **high accuracy** in **detecting both normal and malicious IoT network traffic**. **Sample testing and bulk evaluation** confirmed its ability to **correctly classify various attack types**, including **Mirai botnet attacks, DoS, Scan, and MITM attacks**. The results validate the **effectiveness** of using **deep learning** for **intrusion detection in IoT networks**.
- **Future Improvements:**
 - **Implement real-time IDS deployment**
 - **Integrate unsupervised learning to detect unknown attacks**

Thank You
